

# Main Process Plant Building (MPPB) Controlled Deconstruction Update

Week of February 5, 2024

## Liquid Waste Cell

The Department of Energy's West Valley Demonstration Project (WVDP) continues the deconstruction of the Liquid Waste Cell. Recently, workers safely removed the largest tank from the cell as part of the ongoing demolition of the Main Plant Process Building. The largest tank known as 7D-2, weighs 40,000 pounds and was the main waste collection tank where acidic liquids were neutralized before the waste liquid was transferred through the system. All nine tanks will be removed as part of this cleanup activity.
